                                                                                                                                                                                                                                                                                                                                 RESULT 14
T13447
hypothetical protein T19F6.40 - Arabidopsis thaliana
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 13-Aug-1999 #sequence_revision 13-Aug-1999 #text_change 17-Mar-2000
C;Accession: T13447; T13449
R;Bevan, M.; Peters, S.A.; van Staveren, M.; Dirkse, W.; Stiekema, W.; Bancr submitted to the Protein Sequence Database, July 1999
A;Reference number: Z17587
A;Accession: T13447
A;Molecule type: DNA
A;Residues: 1-332 <BEV>
A;Cross-references: EMBL:AL109619; GSPDB:GN00062; ATSP:T19F6.40
A;Experimental source: cultivar Columbia; BAC clone T19F6

Chem. 277:28909-28915 (2002).

1- FUNCTION: Exhibits an oxidoreductive catalytic activity town retinoids. Most efficient as an NADPH-dependent retinal reductived. Most efficient as an NADPH-dependent retinal reductions high activity toward 9-cis and all-trans-retinol. Involved in the metabolism of short-chain aldehydes. No steadehydrogenase activity detected.

1- SUBCELLULAR LOCATION: Type II membrane protein (Probable). Associated with endoplasmic reticulum membrane.

2- ALTERNATIVE PRODUCTS:

cells of prostate, in both basal and luminal secretory cell populations. Expressed at low levels in spleen, thymus, testis, ovary, small intestine, colon, peripherical blood leukocytes, kidney, adrenal gland and fetal liver. Not detected in prostatic fibromuscular stromal cells, endothelial cells, or infiltrating
                                                                                                                                                lymphocytes.
INDUCTION: By androgens, in prostate cancer cells.
PTM: Not glycosylated.
SIMILARITY: Belongs to the short-chain dehydrogenases/reductases (SDR) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13;

FUNCTION: Exhibits an oxidoreductive catalytic activity towards retinoids. Most efficient as an NADPH-dependent retinal reductase Displays high activity toward 9-cis and all-trans-retinol. Also involved in the metabolism of short-chain aldehydes. No steroid dehydrogenase activity detected. Might be the key enzyme in the formation of 11-cis-retinal from 11-cis-retinol during regeneration of the cone visual pigments (By similarity). SIMILARITY: Belongs to the short-chain dehydrogenases/reductases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

The vertebrate specificity short chain retinol dehydrogenases from
The vertebrate retina.";
J. Biol. Chem. 277:45537-45546(2002).

-!- FUNCTION: Exhibits an oxidoreductive catalytic activity towards
retinoids. Most efficient as an NADPH-dependent retinal reductase.
C. retinoids high activity toward 9-cis and all-trans-retinol. Also involved in the metabolism of short-chain aldehydes. No steroid dehydrogenase activity detected. Might be the key enzyme in the formation of 11-cis-retinal from 11-cis-retinol during
C. -!- TISSUE SPECIFICITY: Widely expressed, mostly in eye, kidney,
Drain, skeletal msucle and stomach.
C. -!- SIMILARITY: Belongs to the short-chain dehydrogenases/reductases
(SDR) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EQUENCE FROM N.A.

TISSUE SPECIFICITY: Expressed at higher level in liver and testis.
Expressed at lower levels in smooth muscle, thymus, submaxillary
gland and epididiymis. In testis, expression is restricted to
pachytene spermatocytes. Also expressed in four layers of the

retina, including the outer segment of rods and cones.

PTM: Not glycosylated (By similarity).

SIMILARITY: Belongs to the short-chain dehydrogenases/reductases (SDR) family.

CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 311.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RDHE HUMAN STANDARD; PRT; 336 AA.

The vertebrate specificity short chain retinol dehydrogenases from

The vertebrate retina.";

J. Biol. Chem. 277:45537-45546(2002).

-!- FUNCTION: Exhibits an oxidoreductive catalytic activity towards

retinoids. Most efficient as an NADPH-dependent retinal reductase.

C.-!- FUNCTION: Exhibits an oxidoreductive catalytic activity towards

retinoids. Most efficient as an NADPH-dependent retinal reductase.

C. -!- FUNCTION: Exhibits an oxidoreductive and all-trans-retinol. No

steroid dehydrogenase activity detected.

C. -!- TISSUE SPECIFICITY: Expressed in brain, kidney, pancreas and

placenta.

C. -!- SIMILARITY: Belongs to the short-chain dehydrogenases/reductases

C. -!- SIMILARITY: Belongs to the short-chain dehydrogenases/reductases

C. -!- SIMILARITY: Belongs to the short-chain dehydrogenases/reductases

C. -!- SIMILARITY: Demily.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-1- FUNCTION: Exhibits an oxidoreductive catalytic activity towards retinoids. Most efficient as an NADPH-dependent retinal reductase Displays high activity toward 9-cis and all-trans-retinol. No steroid dehydrogenase activity detected (By similarity).

-!- SIMILARITY: Belongs to the short-chain dehydrogenases/reductases (SDR) family.
                                                                                                                                                                              YCOSKLAIVLFTKELSRRLOGSGVTVNALHPGVARTELGRHTGIHGSTFSSTTLGPIFWL

retinoids. Most efficient as an NADPH-dependent retinal reductase Displays high activity toward 9-cis and all-trans-retinol. Also involved in the metabolism of short-chain aldehydes. No steroid dehydrogenase activity detected. Might be the key enzyme in the formation of 11-cis-retinal from 11-cis-retinol during regeneration of the cone visual pigments (By similarity). TISSUE SPECIFICITY: Expressed in the eyes. SIMILARITY: Belongs to the short-chain dehydrogenases/reductases (SDR) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Craniata; Vertebrata; Buteleostomi;

Submitted (JAN-2000) to the EMBL/GenBank/DDBJ databases.

-!- TISSUE SPECIFICITY: Widely expressed.

-!- MISCELLANEOUS: Belongs to the pseudoautosomal region 1 (PAR1 located at the termini of the long and short arms of the X a chromosomes. This region is essential for meiotic pairing an chromosomes. This region of the PAR1 region causes male steringenes in the PAR1 region escape X inactivation.

-!- SIMILARITY: Belongs to the short-chain dehydrogenases/reduct (SDR) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    o

"Differential divergence of three human pseudoautosomal genes and
their mouse homologs: implications for sex chromosome evolution.";
Genome Res. 11:2095-2100(2001).
-!- MISCELLANEOUS: Autosomal gene, which is the ortholog of human
DHRSX, located at the termini of the long and short arms of the y
and Y chromosomes.
-!- SIMILARITY: Belongs to the short-chain dehydrogenases/reductases
(SDR) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sureleostomi;

Sato K., Demura T., Fukuda H.;
"Cloning of photosynthesis-related genes and their expression somatic embryogenesis in carrot.";
Plant Cell Physiol. 38:77-77(1997).
-!- FUNCTION: Phototransformation of protochlorophyllide (Chlide).
-!- CATALYTIC ACTIVITY: Chlorophyllide A + NADP(+) = protochlorophyllide + NADPH.
-!- PATHWAY: Chlorophyll biosynthesis.
-!- SUBCELLULAR LOCATION: Chloroplast.
-!- SUBCELLULAR LOCATION: Chloroplast.
-!- SIMILARITY: Belongs to the short-chain dehydrogenases/red (SDR) family. POR subfamily.

A Li J., Timko M.P.;

I The pc-1 phenotype of Chlamydomonas reinhardtii results from a deletion mutation in the nuclear gene for NADPH:protochlorophyllide coxidoreductase.";

T Plant Mol. Biol. 30:15-37(1996).

I PLANCTION: Phototransformation of protochlorophyllide (Pchlide) to chlorophyllide (Chlide).

I PATHWAY: Chlorophyllide + NADPH.

I PATHWAY: Chlorophyll biosynthesis.

I PATHWAY: Chlorophyll biosynthesis.

I SUBCELLULAR LOCATION: Chloroplast.

I SUBCELLULAR LOCATION: Chloroplast.

I SIMILARITY: Belongs to the short-chain dehydrogenases/reductases (SDR) family. POR subfamily.

NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 204340;

```
AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCF primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GAGCTACCCAGGCGGCTGTGTGCAGCACCTCCGCGCCGACTCCGGACGCCTGACGCCT
